

Handle for Cookware

ABSTRACT

5 A handle for use with cookware that has a base and a lid  
defining a cooking chamber. The handle is pivotally  
mountable to cookware about a horizontal axis and moves  
between a lifting position and a stored position. The  
handle has a cam for raising an edge of the lid when the  
10 handle is pivoted towards the stored position. A catch  
can be provided for positioning and holding the handle  
relative to the cookware. The catch has an elastically  
resilient member having a detent for engaging a recess  
positioned with the handle and is released by force  
15 applied to the handle.
